Are there R some packages for analysis of alpha-lattice (0,1) designed experiment? My experiment includes two factors with two levels. The tests are performed in two replications with twenty blocks.

Linear Model for Lattice Design  $Y_{ijl} = \mu + \tau_i + \beta_j + \gamma_l + \epsilon_{ijl}$  Treatment effect  $i = 1, 2, \dots, t$  Replicate effect  $j = 1, 2, \dots, r$

### Incomplete Block Designs - PBGworks

design has two replications of the treatments, it is called a simple lattice; if it has 3 replications it is called a triple-lattice and so on. In general, if the number of replications is  $m$ , it is called an  $m$ -ple lattice. Square lattice designs can be constructed as follows: 1.1 Method of Construction

We also compared alpha-lattice analysis with RCBD analysis in a 2-replicate trial of 453 lines in an upland drought-stress trial in which single-row plots were used. The results of these comparisons are presented in Table 6.1.

### Unit 5: Statistics review - experimental design

lattice designs can be analyzed by usual randomized complete block analysis. Although series of designs mentioned above provide large number of resolvable designs, there are still large number of combinations of  $v$  and  $r$  for which no such design

squares calculated for these trials were (292, 3.67 and 2.41) for alpha lattice and (437, 5.40 and 3.23) for RCB design respectively. The relative efficiency of trials shows that alpha lattice design

was more efficient than RCB design. The value of relative efficiency (1.49, 1.47 and 1.34) indicates that the use of alpha lattice design instead

A Lattice square is a special case of a RC design where balance is not achieved in either direction, but that each pair of treatments appears together in at least one row or column (Hinkelmann and Kempthorne, 2006). One approach useful in plant breeding is to start with an alpha design
