When silica fume is added to concrete, initially it remains inert. Once portland cement and water in the mix start reacting with each other (hydrating), primary chemical reactions produce two chemical compounds: Calcium Silicate Hydrate (CSH), which is the strength producing crystallization, and Calcium Hydroxide (CH), a by-product also called free lime which is responsible for nothing much ...

Fumed silica (CAS number 112945-52-5), also known as pyrogenic silica because it is produced in a flame, consists of microscopic droplets of amorphous silica fused into branched, chainlike, three-dimensional secondary particles which then agglomerate into tertiary particles. The resulting powder has an extremely low bulk density and high surface area. Its three-dimensional structure results in ...

1. Introduction. Alkali-silica reaction (ASR) is a deleterious reaction in which metastable silicates contained in many natural aggregates dissolve in the highly alkaline pore solution of concrete and further coagulate to form a colloidal alkali-lime-silica gel , .This gel is hygroscopic and could swell considerably by imbibing moisture .The resulting tensile stresses can lead to ...
