In mass spectrometry, fragmentation is the dissociation of energetically unstable molecular ions formed from passing the molecules in the ionization chamber of a mass spectrometer. The fragments of a molecule cause a unique pattern in the mass spectrum. These reactions are well documented over the decades and fragmentation pattern is useful to determine the molar weight and structural ...

Strange attractions: Unconventional  $\sigma$ - and  $\pi$ -hole interactions are approached from three perspectives, namely their physical nature, their experimental exploitation and their presence in databases of solid-state structures (CSD/PDB). These data highlight that unusual  $\sigma$ - and  $\pi$ -holes are very similar to more conventional ones (e.g. hydrogen bonding) and are capable of influencing ...

Organic semiconductors are solids whose building blocks are pi-bonded molecules or polymers made up by carbon and hydrogen atoms and - at times - heteroatoms such as nitrogen, sulfur and oxygen. They exist in form of molecular crystals or amorphous thin films. In general, they are electrical insulators, but become semiconducting when charges are either injected from appropriate electrodes ...
